

Rimses 6.4. What's new in this version?

Deloitte has stated that an **ERP system with good usability leads to a 300% increase in user productivity and a 55% reduction in training time** (source). Rimses is therefore continuing to focus on the software's usability in Version 6.4. "A picture is worth a thousand words" is certainly true in the world of asset management. You can use the new **Visual Explorer** to upload photos and drawings of your assets in a tree structure. It is now also much easier to find data in an overview by entering criteria or using a multi-selection.

MANAGING YOUR ASSETS

Rimses now has a visual explorer that allows you to upload photos and drawings of your assets in a tree structure. The uploaded images are interactive, so you can schedule work requests, work orders etc. directly on the components shown in the images.

USER-FRIENDLY SEARCH AND OVERVIEW WINDOWS

Rimses Version 6.4 offers some simplified search and filtering methods.

- **Quick search:** you can find objects, customers and suppliers by entering the first letters of their names in the search field. Rimses will suggest any possible items. Search fields with this functionality will have a different icon.
- **Filtering:** the overview windows allow you to further filter your selection without using the selection window. There are 2 different ways of filtering: by entering your criteria or by ticking several criteria in each column.
- **Colour use:** you can now use even more colours in certain overview windows for work processes in order to draw attention to the data. You can set up the use of colours yourself with the system configuration and user setup.

M	P	S	WO no	Status	Sub status	Priority	Object ID	Work description	Planned start dat

<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	260	Execution		Urgently	MA08	Fix error in control	29/06/2017

WORK PROCESS

- **Campaign tasks** are a new feature that you can use to quickly perform a series of checklist and cluster tasks for installations and machines.
- **Graphic planning by person and Visualization planning and forecast:** if some work orders overlap, you can now push a button to expand the line containing the overlap into several lines. You can then easily drag each work order to a different location without losing the overview of the work orders.
- **Planned maintenance:** you can now systematically plan and execute maintenance with JobServer. Automating this will save you time and reduce the strain on your network during everyday tasks.
- **Vehicle claims management:** this new functionality allows you to use Rimses to follow up claims regarding production equipment and vehicles registered in Rimses.
- **Immediate ordering of projected materials:** in Rimses 6.4 you can order your projected materials directly in the work order projection window without opening the purchasing module.

STOCK REGISTRATION

Automatic receipt: when entering an order line for materials already received, you can now have the receipt at the warehouse registered immediately and automatically without opening the stock module.

RIMSES MOBILE WAREHOUSE

You can now automatically process the receipts and deliveries scanned using the Rimses Mobile Warehouse app with **JobServer**.

TRANSLATION TOOL

The Rimses 6.4 translation tool is also available for eRimses labels.

About RIMSES

RIMSES is a flexible, convenient and above all very user-friendly system developed on the basis of best practices validated by our users. Rimses transforms maintenance data into valuable information to support your maintenance strategy. Its modular setup establishes the basis for each maintenance plan and allows it to anticipate the specific needs of each company or industry in a flexible way. Rimses is also a very complete package that includes stock and purchase management and is easy to integrate into other business systems. It is suitable for internal maintenance departments, but it also supports the specific needs of service companies.
