

Drupal™ Check-Up

Get the most out of your website

An online presence is no longer a distinguishing factor, but a consistent digital experience is. Your (Drupal) website plays an important role in this as a frequently visited contact point. Optimizing Drupal, in terms of both technical set-up and user experience, noticeably boosts the digital experience you offer. Take ownership of this important content platform to get the most out of it.

The drivers for optimization

Hosting & infrastructure

Is your website the odd one out when it comes to integrating your IT landscape? Is the website hosted in the most cost-efficient location?

Compliance & build

How well can your website withstand disaster scenarios? Is your website (still) in line with all regulations? What is the life span of your current site? Are you up to date with the latest version? Is the website actively managed?

User experience

Your website is nice, but is nice good enough? What do your end users think of it? Does it achieve its goal? Is your website easy to find?

Should you care about this? We think so, if you ...

... are an **IT professional** who “indexes” existing applications every year and does not want to lose sight of Drupal.

... are an **IT professional** who would like an independent review of a website that has been delivered or is to be delivered.

... are a **marketing professional** who wants to ensure that the public website cannot damage their reputation.

... are a **marketing professional** who wants to have greater impact with the website in a budget-friendly way.

How can we help you?

We understand that you're apprehensive about renewing your existing infrastructure, or building a new digital platform, but maybe you don't need to? Have you ever considered that there are other ways to handle this?

At Inetum-Realdolmen, we believe in a targeted and efficient approach that will allow you to sleep on both ears again!

Take control with our **Drupal Check-Up**

An analysis of your current website, tailored to your actual needs or wishes. We have developed a selection based on the three pillars for getting the most out of Drupal. Each pillar can stand on its own for a short but powerful check. Or you can opt for a comprehensive and decisive approach by employing all areas.

Resilience Check

We make a copy of your source code in a protected environment and push it to the limit, e.g. by staging a hack. Where was it weak? Where did the code stand up?

We test this in various ways:

- Blackbox pentest: penetration testing without viewing the code
- Stress testing with profiler: looking for performance hot spots
- SAST, DAST & dependency scanning (automated)
- Review of manual custom development

Hosting Check

We check your existing hosting setup. Are the servers in good shape? Is the correct configuration used? Is the security okay?

We have a good look at:

- Configuration of servers, routers and firewall
- Deployment procedures
- Rollback procedures
- Disaster recovery
- Ability to change hosting provider
- Logging & follow-up

UX Check

We zoom in on the front of your website, the side your customers see. Does it meet their current expectations?

Some of the things we look at:

- User-friendliness in terms of content administration
- SEO
- Accessibility for visually disabled persons
- End user experience: can they find what they're looking for, can they finish what they've started, etc.?
- Match between website design and presumed company identity

What's in it for you?

You always receive a detailed report from us, which we explain during an extensive presentation. A list of optimization proposals with risk assessment that you can take action on is also included.

Based on your needs and wishes, we can also provide numerous extras: setting up automated implementations on a CI/CD tool, training, automated E2E tests, etc.

Ideal in the following situations:

- As an annual check
- When changing provider
- As a security check focusing on GDPR and cookie policy
- Drupal running for more than two years without significant updates and/or modifications
- Drupal hosted internally without a maintenance contract
- Drupal slow and/or hacked
- Website no longer meets requirements, but not yet written off
- Poor or no integration with existing IT landscape
- Independent audit for third-party delivery
- Not found by search engines
- Website not user-friendly
